

ByteBloc

Emergency physician scheduling software that automates complex shift relationships, payroll, and provider requests via web and mobile apps.

<https://www.bytebloc.com/>

Overview

ByteBloc is an Emergency Physician Scheduling Software designed by an emergency room physician and founded in 1989 to manage the complex facets of scheduling for emergency medicine providers. It is a SaaS-based product that has been implemented in emergency rooms across all 50 U.S. states, Canada, and other countries. The software is also adaptable to the scheduling needs of groups outside of emergency medicine.

Key features for the **Schedule Administrator** include automated schedule creation, full control over schedules, automated gathering of on/off and future requests, shift balancing, and payroll reports with multiple pay structures and rate variations. The system's powerful customizer allows for easy schedule configuration, making schedule creation as simple as pushing a single button once configured to specifications.

For the **Provider**, the system offers 24x7 online and native mobile access to personalized schedules, the ability to enter requests for shifts/time off/vacation, shift swapping/trading (swap-meet), management of availability, and push notifications/reminders via email and text messaging. The software supports multi-location schedules, synchronized calendars, and a document repository for sharing important information like memos and slips.

ByteBloc is categorized as a solution for Dynamic Staffing & Scheduling, Human Capital Management, and Clinician Burnout.
