

EpiSoft

Cloud-based Electronic Medical Records (EMR) and Practice Management software specializing in oncology, chemotherapy, and chronic disease management.

<https://example.com/1762583716457>

Overview

EpiSoft is a multi-centre, multi-tenanted Software as a Service (SaaS) solution designed for the management of patients with severe chronic illnesses, with a primary focus on oncology and chemotherapy. Developed by EpiSoft Health, an Australian eHealth company founded in 2005, the platform serves individual practitioners, multi-site clinics, day hospitals, and tertiary hospitals.

Key Features and Capabilities

The software provides a comprehensive suite of tools for clinical and administrative workflows:

Oncology & Infusion Drug Management: Australia's only cloud-based standalone EMR for infusion drug management, including e-prescribing, compounded medication ordering, and drug administration charting.

Smart Scheduling & Treatment Planning: Features for complex date-driven care plans, such as chemotherapy cycles, including smart protocol scheduling, chair management, and automated SMS/email reminders.

Epi-Me Patient Portal: A highly-engaging, mobile-friendly patient engagement portal that allows patients to complete demographic and health history information, view upcoming treatments, and manage appointments.

Referrer Portal: Streamlines the referral process, providing validated, legible referral information directly into the practice software.

Practice Management & Billing: Includes cash flow management with integration for faster claim payments (e.g., Medicare, health funds, DVA) and a robust billing module.

Clinical Data Capture: Tailored clinical data capture tools for specialties like cancer, hepatitis, Crohn's disease, and mental health, which also supports clinical research and outcomes analysis.

Secure Communication: Letter writing module with secure messaging capabilities.

Target Users and Use Cases

EpiSoft is tailored for healthcare providers managing complex, chronic conditions, with key use cases including:

Oncology/Chemotherapy: Management of cancer treatment, including adherence to evidence-based guidelines (like eviQ protocols) and clinical trial protocol setup.

Chronic Disease Management: Solutions for mental health, chronic viral hepatitis, and Inflammatory Bowel Disease (IBD).

Hospital Workflow: Hospital Preadmissions/eAdmissions and Infusion Management.

Clinical Research: Leveraging real-world evidence from the system to identify safer, more effective treatments.

Key Features

- Oncology & Infusion Drug Management
- Epi-Me Patient Portal
- Smart Scheduling & Chair Management
- Treatment Planning (e.g., eviQ protocols)
- Practice Management & Billing
- Clinical Data Capture & Reporting
- Secure Messaging & Letter Writing
- Referrer Portal
